

play

- Hardware Accelerated High Resolution RAM based image sequence playback.
- Many formats (DPX, OpenEXR, TIFF, TGA, JPEG, BMP, etc)
- Play up to four 2K streams at once 4K playback capable (hardware dependant)
- Different viewport layouts (single, 2x2, side by side, top and bottom)
- Real Time transformations (zoom, pan, flip, flop)
- Once, Loop and Ping Pong playback modes.
- DPX Metadata Display
- Real Time Aspect Ration modifications, with option of deforming the image (for anamorphic) or cropping with black bars.
- Automatic Proxy Generation
- Area of Interest loading
- Low hardware requirements
- Fully multithreaded

process

- Process image in Real Time and Full Resolution using gaming level hardware.
- Easy to write plug-in system based on XML text files and the OpenGL Shading Language.
- Apply these and other FXs in Real Time
 - 1D and 3D LUTs
 - Brightness, Contrast and Saturation
 - Gamma Correction
 - Primary Color Correction
 - Difference Mattes
 - Pre-comps (mix, over, inside, outside, green and blue chroma keys etc)
 - Anaglyph Stereo image creation.
 - Split screen in any angle and position.
- FXs are stackable, apply as many as you want.
- Flexible LUT format (if you can process an image with your LUT, then we can use it)
- Render to image sequences.

share

- Participate in JefeCheck Remote Sessions: playback and review sequences over a network or the Internet with as many participants as you want.
- Control all aspects of the playback from any workstation in the session.
- Apply any FX on any computer in the session, what you see is what everyone else sees.
- Hold remote sessions between Windows, OS X and Linux workstations.
- Secure: no image information travels over the network, frames must be synchronized on both computers beforehand.
- Use remote pointers and text chat to communicate exactly what you want to all other participants.
